**THREAT DETECTION &
ANALYSIS SERVICE**

CYBERSEER THREAT DETECTION & ANALYSIS SERVICE

Cyber threats are increasing daily by number and sophistication. As a businesses intelligence grows, so does its critical data. Business relies on the confidentiality, integrity and availability of its data. Having visibility in the core of your network is vital to detect the presence of sophisticated threat actors. Identifying these threats early in their life-cycle allows an organisation to respond quickly and effectively.

Cyberseer operates a portfolio of advanced threat technologies, which all come together with our threat detection and analysis service.

This is an intelligence driven service which leverage's expert human analysis to provide timely, accurate and actionable information about the threats we have identified in your environment.

Our Analysts operate within a mature alert handling process to harness the intelligence from our deployed technologies. Cyberseer alerts you to new threats as they occur and provides you with detailed regular reports into the current threat status of your environment.

ADVANCED THREAT ANALYSIS:

Our Analysts are highly trained in configuration and optimisation of the Cyberseer advanced threat detection technologies which provide the foundation for their analysis capabilities.

Analysts continually review the output from deployed technologies to identify unusual or concerning patterns of behaviour that may be indicative of threats.

Once identified, threats are investigated within the Cyberseer incident analysis framework which aims to balance the competing goals of comprehensive analysis and time-critical response. This framework is based around a scoring and escalation process designed to provide you with the information you need to prioritise and effectively respond to threats. Rather than provide you with a long list of alerts, or Indicators of Compromise (IOC's), our Analysts draw on their experience, the context of your alert in your environment and external sources of intelligence, to provide you with an explanation and analysis of each threat they discover.

When deciding how to respond to possible threats within your environment, it is useful to ask yourself two questions:

- **How good is the evidence for this threat?**
- **How serious would the consequences be if it was real?**

To aid in this decision making process our Analysts rate each threat by both severity and confidence, so you can effectively decide what to make your priority. These separate scores are combined to give you a sense of the urgency of each threat, and the most urgent ones are communicated to you upon discovery.

REPORTS:

As well as communicating priority threats as they are discovered, our Analysts track and record the details of each threat they investigate. The scores and classifications of less urgent threats are used to produce monthly Threat Intelligence Reports. The core of these reports is the Threat Rating, which provides a relative measure of the number and seriousness of identified threats on your network. The Cyberseer service tracks and trends this rating on a month by month basis so you can see whether your threat status is improving. The monthly reports break down this threat score by threat categories enabling you to identify areas of weakness in your security posture and help make informed investment decisions to bolster your defence in depth. Each report includes technical details on identified threats as well as an executive summary so you can quickly get a feel for the nature and seriousness of the threats you are currently facing.

SERVICE SUMMARY:

- **Threat identification and classification** by cyber security experts.
- **Real time detailed and actionable alerts** for serious threats requiring urgent action at time of discovery.
- **Weekly updates** on newly classified threats.
- **Monthly threat intelligence reports** providing a comprehensive breakdown of outstanding issues and threats in your environment.
- **Monthly metrics** on the overall threat level and tracking the status of previously reported threats.

Choose Cyberseer as your advanced threat intelligence service partner.

WHY USE ADVANCED THREAT INTELLIGENCE SERVICES FROM CYBERSEER:

Decrease incident response times and costs by detecting attacks early and acting sooner. Outsource threat detection and analysis to Cyberseer and provide your team with the tools to target real issues. Through an open and collaborative partnership we can enable you to:

Protect your brand, data integrity & operations.

Only through real-time threat notification of malicious network activity and granular visibility of data movements within the enterprise can you maintain brand credibility, operations and protect all intellectual property.

Redirect skilled in-house resources & budgets.

Deliver greater value to your organisation by using our people who possess the knowledge, skill-set and experience you need and the best-of-breed technologies to ensure your corporate network remains robust.

Gain complete visibility of the core of your network.

Let our Analysts monitor and investigate events of interest to identify potential threats and build a clear, real-time picture of activity from each and every device on your network.

Anomalous behaviour is interpreted to provide you with a threat rating, which depicts the severity of outstanding threats on your network and the organisations associated risk.

Reduce incident response times and costs.

With our service you can detect unknown threats to enable a proactive and prioritised response. This ensures productive and targeted use of your resources by focusing on active real threats.

Protect against insider threat.

Identify threats inside the perimeter that have evaded existing security controls.

Identify threats early.

Identify and disrupt threats early in their life-cycle before their overall attack objective can be achieved.

Powerful insight.

Simple technology deployment provides access to powerful, zero knowledge, signature-less detection capabilities.

CYBERSEER Your advanced threat intelligence service partner.
